1. Use a suction cup on the rear panel of Q2 to open the device. The panel is lightly glued to the body, so the first opening can demand slightly more force. Heating pad or other smartphone repair tools can be used to assist.

   WARNING!! Rear panel is connected by 3 cables to the main board, be careful not to damage these cables during removal of the back panel.

2. Start disconnecting the cables from main board. Begin with the black Wi-Fi cable and the grey Bluetooth cable, both are simple coaxial connectors. Then disconnect the battery connector.
3. Bluetooth antenna overlaps with the battery, carefully peel it off from the battery, to free it up for repair.
4. Battery is connected to the rear panel with double sided tape. Remove it and install new battery in the same way.
